Q25.	 <p>Let AP and BP be the two tangents to the circle with centre O. To Prove : $AP = BP$ Proof : In $\triangle AOP$ and $\triangle BOP$ $OA = OB$ (radii of the same circle) $\angle OAP = \angle OBP = 90^\circ$ (since tangent at any point of a circle is perpendicular to the radius through the point of contact) $OP = OP$ (common) $\therefore \triangle AOP \cong \triangle BOP$ (by R.H.S. congruence criterion) $\therefore AP = BP$ (corresponding parts of congruent triangles) Hence the length of the tangents drawn from an external point to a circle are equal.</p>	1 1

Q28.	<p>To prove that $\sqrt{7}$ is an irrational number, we will use the contradiction method.</p> <p>Let us assume that $\sqrt{7}$ is a rational number with p and q as co-prime integers and $q \neq 0$</p> $\Rightarrow \sqrt{7} = p/q$ <p>On squaring both sides we get,</p> $\Rightarrow 7q^2 = p^2$ <p>$\Rightarrow p^2$ is divisible by 7. Therefore, p is also divisible by 7.</p> <p>So we can assume that $p = 7x$ where x is an integer.</p> <p>By substituting this value of p in $7q^2 = p^2$,</p> $\Rightarrow 7q^2 = (7x)^2$ $\Rightarrow 7q^2 = 49x^2$ $\Rightarrow q^2 = 7x^2$ <p>$\Rightarrow q^2$ is divisible by 7. Therefore, q is also divisible by 7.</p> <p>Since p and q both are divisible by 7, which gives contradiction that root 7 is a rational number in the form of p/q with "p and q both co-prime numbers" and $q \neq 0$.</p> <p>Thus, $\sqrt{7}$ is an irrational number by the contradiction method.</p> <p>Now $5 - 3\sqrt{7}$ is an irrational number because rational - irrational are always irrational. $$= 1/\sin \theta \cos \theta + 1$$

$$= 1 + \sec \theta \operatorname{cosec} \theta = \text{R.H.S.}$$

Therefore, L.H.S. = R.H.S.

Or

$$(\cos A + \sin A + 1)/(\cos A - \sin A + 1)$$

Divide the numerator and denominator by $\cos A$, we get

$$= (\cos A + \sin A + 1)/\cos A / (\cos A - \sin A + 1)/\cos A$$

We know that $\sin A/\cos A = \tan A$ and $1/\cos A = \sec A$

$$= (1 + \tan A + \sec A)/(1 - \tan A + \sec A)$$

$$= ((\sec^2 A - \tan^2 A) + \tan A + \sec A)/(1 - \tan A + \sec A)$$

$$= ((\sec A - \tan A)(\sec A + \tan A) + (\tan A + \sec A))/(1 - \tan A + \sec A)$$

$$= (\sec A + \tan A)(\sec A - \tan A + 1)/(1 - \tan A + \sec A)$$

$$= \sec A + \tan A$$

$$= 1/\cos A + \sin A/\cos A$$

$$= (1 + \sin A)/\cos A = \text{R.H.S.}$$

Therefore,
$$\frac{1 + \cos \theta + \sin \theta}{1 + \cos \theta - \sin \theta} = \frac{1 + \sin \theta}{\cos \theta}.$$

Q32.

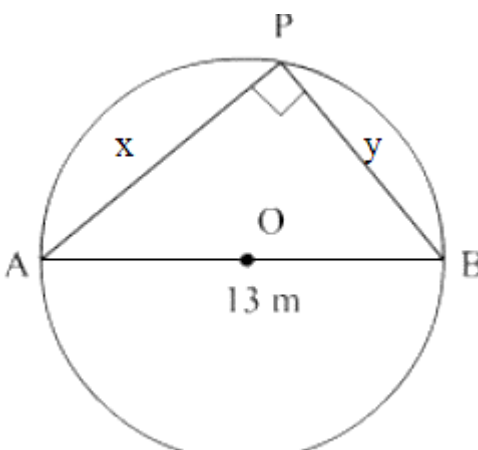

Given: In $\triangle ABC$ and $\triangle PQR$, AD and PM are medians such that $\frac{AB}{PQ} = \frac{AC}{PR} = \frac{AD}{PM}$.

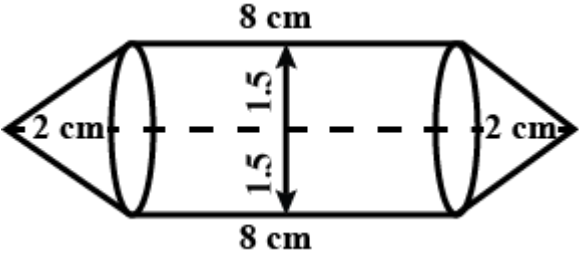

To Prove: $\triangle ABC \sim \triangle PQR$.

Construction: Produce AD to E such that $AD = DE$. Join CE .

	<p>Similarly produce PM to N such that PM = MN, also Join RN. Proof: In $\triangle ABD$ and $\triangle CDE$, we have AD = DE [By Construction] BD = DC [\because AD is the median] And, $\angle ADB = \angle CDE$ [Vertically opposite angles] $\therefore \triangle ABD \cong \triangle CED$ [By SAS criterion of congruence] $\Rightarrow AB = CE$ [by CPCT].....(i) Also, in $\triangle PQM$ and $\triangle MNR$, PM = MN [By Construction] QM = MR [\because PM is the median] And, $\angle PMQ = \angle NMR$ [Vertically opposite angles] $\therefore \triangle PQM \cong \triangle MNR$ [By SAS criterion of congruence] $\Rightarrow PQ = RN$ [by CPCT](ii) Now $\frac{AB}{PQ} = \frac{AC}{PR} = \frac{AD}{PM}$. $\Rightarrow \frac{CE}{RN} = \frac{AC}{PR} = \frac{AD}{PM}$. [From(i)and(ii)] $\Rightarrow \frac{CE}{RN} = \frac{AC}{PR} = \frac{2AD}{2PM}$. $\Rightarrow \frac{CE}{RN} = \frac{AC}{PR} = \frac{AE}{PN}$. [$\because 2AD=AE$ and $2PM=PN$] $\therefore \triangle ACE \sim \triangle PRN$ [By SSS similarity criterion] Therefore, $\angle 2 = \angle 4$ Similarly, $\angle 1 = \angle 3$ $\therefore \angle 1 + \angle 2 = \angle 3 + \angle 4$ $\Rightarrow \angle A = \angle P$...(iii) Now, in $\triangle ABC$ and $\triangle PQR$, we have $\frac{AB}{PQ} = \frac{AC}{PR}$ (Given) $\angle A = \angle P$ [From(iii)] $\therefore \triangle ABC \sim \triangle PQR$ [By SAS similarity criterion]</p>	<p>1</p> <p>1</p> <p>1</p> <p>1</p>

Given:

Height (h) of the cylindrical part = 2.1 m

Diameter of the cylindrical part = 4 m

Radius of the cylindrical part = 2 m

Slant height (l) of conical part = 2.8 m

Area of canvas used = CSA of conical part + CSA of cylindrical part

$$= \pi r l + 2 \pi r h$$

$$= \pi \times 2 \times 2.8 + 2 \pi \times 2 \times 2.1$$
