

Glimpses of activity conducted in the month of November 2024

Club members attended a workshop on "Building Mega Structures," on 14 November 2024. In this session, students explored the engineering behind the stability of enormous structures like rockets and telescopes. They took on the role of engineers, designing and building their own truss structures. By testing the strength of these models under various constraints, students gained practical insight into how strategic design enhances the strength and resilience of real-world mega structures.
